TWENTY20 – Class 9 exemplar

Monitoring at your fingertips.

Twenty20 pushes all information from your operations in real-time to our integrated web-based dashboard, providing you accurate intelligence via any web-enabled device. Your in-house security personnel can actively monitor locations, respond to system-generated events and alerts, or let the Twenty20 monitoring team provide support for you and your team.

Prevent crime by deterring perpetrators and transients.

Our video, radar and time-lapse surveillance solutions can be deployed as part of a permanent system or even more quickly on a skid or trailer.

Video Surveillance >

Radar Surveillance >

Time-Lapse >

- Video: 24×7 HD video recording, accessible remotely
- Industrial-Grade Cameras: PTZ, bullet and thermal
- Self-contained unit for remote environments
- Deployment: Trailer, skid or in-ground
- Connections: Extended range cellular, satellite or LAN
- Solar, line or generator powered

LEARN MORE

- Surveillance that covers wide area infrastructure and extends beyond fences
- Industrial-grade cameras operate day and night, in all weather conditions and reduce false events
- Provides exact position, angle of movement and velocity of moving objects

Smart Lock

Twenty20's innovative SmartLocks revolutionize access control for remote locations. By replacing old-fashioned padlocks with SmartLocks, you can secure anything – valuable tool boxes, ranch gates, storage facilities – all without installing any complex equipment or systems and whether or not you have reliable connectivity. The Twenty20 Smartlock can be used as a standalone solution or integrated into clients' existing Twenty20 system.

The Twenty20 SmartLock gives each user a digital "key" via their smartphone, which is unique to both the individual and to each SmartLock. You have total control over which users can open which locks. No more lost keys or unauthorized access, and because each key is unique to each user and SmartLock, you get a complete access history log with location and timestamp data. One click from an administrative user authorizes or deauthorizes the individual or lock form the platform.

Remote Computing Unit

Our Remote Computing Units (RCUs) provide real-time, two-way communication between field devices – such as sensors, gauges, cameras, radar units and access control stations – and both your command center and Twenty20 dashboard. The proprietary Edge Procession Unit (EPU) prioritizes data transmissions, saving bandwidth and power consumption, so you can view historical and real-time information without incurring expensive data fees.

Extended Range Cellular

Twenty20 utilizes proprietary technology to pull in cellular connectivity even in areas where cellular phone coverage is weak or unreliable. Connectivity in the most isolated environments, combined with solar power systems and battery monitoring technology, make Twenty20's solutions ideal for remote locations.

Integration and Custom Solutions

Do you need your remote site data integrated into your fusion center? Need to connect with third parties such as the Railroad Commission of Texas or TexNet? Would automation improve the effectiveness of your ticketing process? Twenty20's highly experienced team of in-house developers can deliver solutions specific to your business case.
