

OVERVIEW OF KAMIND IT SECURITY

KAMIND IT Security enables MSPs to deliver a complete, end to end cyber security offering without having to build and maintain in house operations. The solution combines powerful software with a suite of SOC services to deliver both foundational security and highly advanced protections for SMB customers including endpoint management, Azure Sentinal, advanced threat intelligence and the capabilities and reporting required to ensure compliance in modern business environments.

Shield

This is our basic plan that includes the minimum security components that you need if your business is a low risk business. Naturally, things can still go wrong, and a security incident will need to be addressed when it happens, but with the Shield plan and the follow through with our security training, you will be able to manage your business effectively. This plan is designed for the hands on business owner or IT professional that will be directly managing your network and data assets.

Armor

Do you have an existing help desk and security staff, but are looking for extra security support? Our Armor plan is designed for you. The plan supports the IT manager that is looking for extra security but wants to make Learn more at kamind.com/security the decision on how to remediate security incidents and support the end users. The Armor plan sets up the basic security systems and monitoring necessary to mitigate a security incident but is designed for the IT manager that is looking for a balance of cost and Office 365 management. The Armor plan is designed to provide the necessary information notices to the IT manager similar to what we have in our Fortress Plan but we leave the proactive management decisions up to you to decide on what and how to handle everything. Our Security Staff will configure and manage the alert management systems based on the business rules of the organization. When an alert is generated, we will notify your organization's key contacts.
