ABOUT OUR LAWN GRASS SEED

The Nature's Seed Difference

Nature's Seed only stocks turf varieties that have been top-rated by the National Turfgrass Evaluation Program (NTEP). These elite varieties have been bred for superior genetic traits such as color, density, drought tolerance, and disease and pest resistant. You won't find these varieties at big-box stores.

Once we've acquired the best seed possible, we submit it to rigorous quality controls including custom cleaning, purity, and viability testing performed by independent seed laboratories. And unlike other seed companies, we sell all our grass seed in PLS (pure live seed). This means you get the exact amount of viable seed that you order, every time.

But which seeds should you choose, and how do you plant them effectively? Below, we share some tips on which grass seed types to choose, when to seed your lawn, and how to choose a grass seeder that works for you.

Grass Seed Types

Lawn grass can be classified into two main types: cool-season and warm-season. As you might have guessed, cool-season grasses perform better in the northern half of the United States while warm-season grasses are better adapted to the southern half.

The most popular cool-season lawn grasses include Kentucky bluegrass, perennial ryegrass, and fescues. Some of the most popular warm-season grasses include bermudagrass, zoysiagrass, buffalograss, and bahia.

What about the transitional zone where the northern half of the country meets the southern half? In these areas, both cool and warm-season types can be used — although we usually recommend a tall fescue blend for better coverage.

When to Seed Lawn

After you've determined if you'll be using cool-season or warm-season species, you're ready to determine your planting date.

Ideally, cool-season grasses should be planted in the spring or fall when your average high temperatures between 60-75 degrees. Warm-season grasses should be planted in the spring or early summer when your average high temperatures are

above 80 degrees.

Lawn Grass Seeders

THERE ARE SEVERAL DIFFERENT MAKES AND MODELS OF SEED SPREADERS:

Hand-held Broadcast Spreaders

These are some of the most common and least expensive types of spreaders available. The spreader is held with one hand while the other hand cranks on a handle, flinging the seed over a distance as you walk across an area. These spreaders work great for smaller lawns, but aren't practical for large lawns or sports fields. Flow rate accuracy and quality can also be questionable on some models.

Tow Behind/Push Broadcast Spreader

These types of spreaders fling seed just like the hand-held versions, but are wheeled across the ground instead of carried and are much more efficient for large areas. However, what you make up for in speed and efficiency you lose in precision. Best used for large open areas.

Drop Spreaders

Drop spreaders are also wheeled and pushed/towed along the ground, but instead of flinging seed over a distance they "drop" seed from the bottom of the spreader in a very precise, controlled manner. Drop spreaders are an excellent choice for seeding irregularly shaped lawns and keeping seed out of flower beds, sidewalks, etc. but are more time-consuming than broadcast spreaders.

Slit Seeders

Slit seeders are engine-powered machines that cut small grooves into the soil and place the seed directly into these slits all in one pass. They offer unmatched efficiency, accuracy, and seed-to-soil contact and produce some of the best results, but are tricky in tight areas. Used extensively by professionals and can also be rented by homeowners.

REGIONAL WILDFLOWER MIXES

INDIVIDUAL WILDFLOWER SPECIES

There's nothing in the landscape quite as eye-catching as a wildflower garden. Naturalistic, beautiful, and slightly whimsical, wildflowers can spice up any yard and attract wildlife such as butterflies, hummingbirds, and other beneficial pollinators. Wildflowers come in all sizes, forms, colors, and textures. Many are native to the U.S. while others have been introduced and naturalized.

Select the right wildflower seed for your area.

The first thing to determine when selecting wildflowers is climate conditions and water needs. Some are perfectly adapted to hot, dry areas and work well in water-wise and low-maintenance landscapes. Others thrive in cooler climates and require supplemental irrigation to reach their full potential.

Consider perennial versus annual wildflowers.

Consider whether annual or perennial wildflowers are desired. Annuals will complete their lifespan during one growing season, while perennials will come back year after year. There are advantages and disadvantages to both types. While annuals will die at the end of the season, some will actually self-seed and come back year after year anyway. Annuals also give the gardener the option of redesigning their

gardens each year, something many people enjoy doing. Perennials are great for people looking for a more permanent garden as these perennial-type wildflowers will grow back new each season, saving time and money. However, perennials tend to take longer to mature and may limit the flexibility of garden design.

Placement is the key to a beautiful wildflower garden.

Also be aware of placement when sowing wildflower seed. While most prefer full-sun, there are many that can handle part-sun/shade or even full-shade. Height can also be a factor in wildflower placement, so consider the mature size of the plant when planting seed.

Our specialty seed blends are truly special

Here at Nature's Seed we're committed to solving problems on your property and fulfilling your vegetation needs. These problems and needs come in many forms—whether your property is being degraded by erosion, a wetland needs to be restored, wildfire damage is trying to be avoided, or if you just want to improve the habitat and diet of your local wildlife—our specialty seed blends are the solution for you.

Like an artist's palette or a handyman's toolbox, nature has provided us a multitude of plant materials to work with—each with unique and valuable characteristics. Every grass, legume, wildflower and forb in our specialty seed blends has been researched and selected for its ability to perform a certain function within your property. Climate conditions, rainfall amounts and soil types have also been thoughtfully considered, and each specialty blend has been tailored to thrive in your particular area of the country.

About Southwest Desert

The wildflower seed growing region for the Southwest Desert area is an arid to semi-arid, desert environment, with some mountain areas. Summer monsoonal storms provide some rainfall, but it is generally very dry. We have developed our wildflower seed blends for this region to be extremely drought tolerant, and we use high quality wildflower seed with no fillers to help provide coverage in this generally harsh environment.
