# DMS DAS Management Systems

SOLiD's DASTrax DMS-1200 provides an enterprise level interface point between the fiber optic distributed antenna system DAS) and your network operations center (NOC).

The DMS-1200 gathers vital system information and alarm data from the DAS network and transmits via SNMP to the designated NOC facility for monitoring.

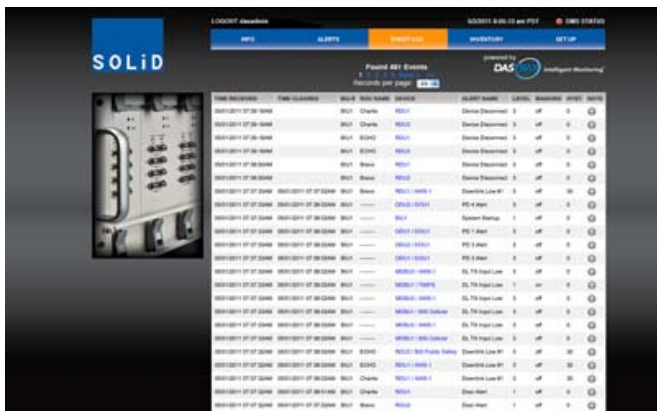

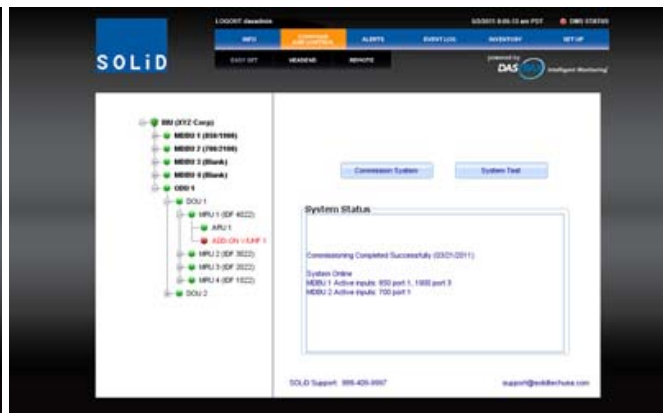

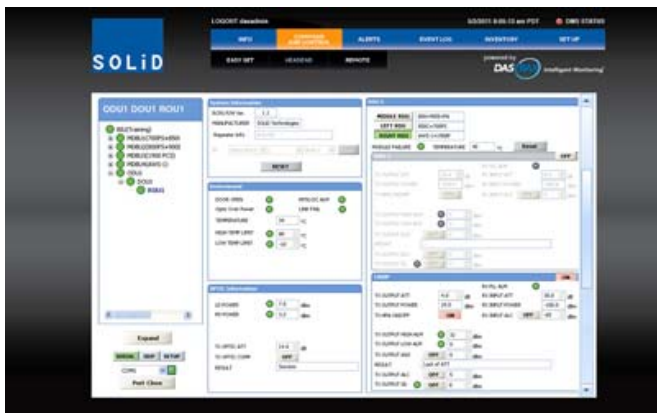

The DMS-1200 keeps downtime to a minimum and ensures your SOLiD system remains reliable. Comprehensive DAS system health checks are continually conducted and changes in status and alarm detection are reported in real-time.

Whether you monitor with your own network computer, or utilize a sophisticated carrier-grade NOC (services/maintenance-and-monitoring.html), the DMS-1200 is the interface that will perform to the highest of standards in any application.

SOLiD Management Software
In addition to the DASTrax DMS, SOLiD's management and configuration software may be used to view and adjust critical device settings either remotely or on the local network.
