ABOUT US ▾

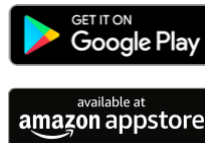

WHO IS IT FOR?

Problems in sound processing are common features of many developmental and learning disorders, including autism spectrum disorders, dyslexia, and ADHD. For some children and adults, sound hypersensitivities are particularly problematic. Sounds from vacuum cleaners, thunder, crying babies, and other sources may cause extreme discomfort and distraction. Developed by a team of brain scientists, **adAPT** is a novel educational intervention that is delivered via an app and uses music modulation for guiding the brain to become a better processor of auditory information. If you are an adult or have a child (5+ years) with sound hypersensitivities, please read the white paper below to learn more about the [science](#) and [contact us](#) if you have any questions about if this app is for you.
