CLOUD **PASS**

User validation and authentication with Single Sign On

Cloud Pass is the most reliable technology solution on the market for user authentication in OTT platforms.

It supports the highest concurrent user loads and is the authentication technology favored by the main high-concurrency, live event streaming companies.

It uses a single sign-on (SSO) model to recognize users, granting them access to contents on all their devices.

Cloud Pass is available to validate and authenticate users from web browsers, native applications, phones, tablets, Smart TVs and game consoles.

It is possible to integrate this technology into payment and/or billing platforms through Pay Per View or Subscription modules. It even allows you to create guest access accounts through the Try&Buy mode.

Features

Integrated Solutions

- Profiles: up to 5 profiles per account.
- Bookmarking: content display storage and bookmark management.
- Concurrency Control: maximum setting of simultaneous users with the same account.
- Parental control: restricted access to adult content.
- Unity: content distribution solution
- IDP Service: Identity provision and subscription management service created to support high levels of concurrency.
