

The DURA·EDGE Difference

Most infield soils are mined from the ground and screened off at a certain size and sold. In other words, it is what it is. But for DuraEdge infield soils, screening is just the beginning.

After harvesting the raw materials for our infield soil products, we mechanically blend the sand and clay together at specific ratios creating a consistent blend year after year.

INFIELD

We understand that all fields are different and thus require different materials. After we assess your field to determine its current condition and what it needs to achieve optimum playability, we offer a variety of infield solutions to choose from to customize your field.

At DuraEdge, we believe that **not all dirt is created equal.**

GRANT'S E.S.T.
ENGINEERED SOIL TECHNOLOGY

Engineered Soil Technology (E.S.T.)™ outperforms other methods because it is based on Soil Science, Not Guesswork. Grant's E.S.T. Program® assesses the current state of an infield, then prescribes specific corrective measures to transform a poor infield into one with the highest performance possible.
