**#scientificmonday** at MMRI, the study of genetics is the science that holds everything together. Whether it be autism, lupus, or diabetes research, genetics is involved throughout the study. MMRI's mission aims to understand and identify the leading causes of diseases, and the genetics core makes it possible. The core allows scientists to look at the specific genetic makeup of a patient, and better locate and make a more accurate and specialized diagnosis on why the disease occurred. This research will make it possible to create gene-specific therapies and cures for the diseases in question.
