## Unlock Unstructured Data. Streamline Business Decisions.

Unstructured data has remained an unexploited resource because it is too expensive and difficult to access and analyze. This results in missed opportunities to reduce operating expenses and the risk of human errors while gaining visibility into processes.

SparkCognition has developed a solution that automates workflows of unstructured data within organizations so humans can focus on high value business decisions. DeepNLP uses advanced machine learning techniques to automate the retrieval of information, classification of documents, and content analytics.

DeepNLP integrates into existing workflows to enable organizations to better respond to changes in their business and quickly get answers to specific queries or analytics that support decision making.

### Improve your operations with total asset protection
