## Mimix™ Product Overview

With Mimix™ Small Joint Resection Blades, surgeons no longer have to make do with resection blades that were originally designed for other joints. We worked with some of the world's foremost small joint surgeons to develop the first resection blades that are specifically tailored to mimic small joint anatomy.\* These blades feature a curvature and working length that's designed to give surgeons easy, fast and precise access in tight anatomical spaces.

- Unique 35° gradual bend designed to contour to the talus
- Available in 2.9mm & 3.5mm configurations for convenient access in tight spaces
- 8cm working length to reach further than traditional 7cm small joint blades
- Diamond-Like Carbon coating on distal cutting tip has a lower coefficient of friction than standard steel and has shown reduced metal particulate generation when compared to leading competitors<sup>1,2,3</sup>
- Designed to minimize the need for a posterior portal during ankle scopes

<sup>1</sup>TR17-00073, <sup>2</sup>TR17-00165, <sup>3</sup>TR17-00073-1, \*Compared to other major medical device manufacturers
