

Essex Capability Statement

Essex provides professional services to academic medical centers, government entities, and biopharmaceutical commercial companies that are engaged in scientific and health care research. Essex focuses on existing, new, and emerging technologies, and on creating the integration needed to share information across the translational research domain.

Key to this effort is the ability to understand and achieve the current, tactical goals of an organization while setting the stage for long-term, strategic goals. This is critical in research and healthcare, where pragmatism must balance vision.

The Essex Team has both breadth and depth of skills, expertise, and experience to ensure the success of bioinformatics and IT projects.
