A growing number of cyber-attacks show that simply abiding by compliance, and managing cyber risks through multiple cybersecurity products alone is no longer sufficient to protect companies. Instead, enterprise cyber risk should be correlated and quantified based on mission-critical business demands. Hence, security and risk management leaders need cyber risk quantification platforms that bring enterprise-wide visibility of cyber risks and give real-time, actionable insights to prioritize and manage such risks. View our session as experts walk through what Cyber Risk Quantification is all about. With the proper solution and framework, learn how to prioritize critical areas throughout a company's key infrastructure and most vulnerable vectors across people, processes, and technology, for both 1st and third-party. Key Take-Aways: - Applying an accurate measure of the company's vulnerability to several types of cyberattacks, based on ATT&CK MITRE. - A quantified perspective to improve the real-time visibility of a company's overall cybersecurity. - Employing automation in highlighting security issues to limit the possibility of a breach using breach-likelihood prediction.
