Largest as of January 2020

SQ4D has completed construction of the world's largest permitted 3D printed home as of January 2020. The home is 1,900 square feet and took only forty-eight hours of print time, over an eight-day period. The home was entirely printed and built onsite using less than \$6,000 in materials. Future print-time is expected to be reduced on the next projects, due to ARCS enhancements implemented post-construction.

Replica virtual reality walkthrough

Take a peek at our fully immersive VR technology that allows you to design, furnish, and explore a home before it's even printed. Click the button for a demonstration that takes place in the exact same house design as the demo home in Calverton, NY.
