Ozonated Rizole Oils

Ozonated Oils, or Rizoles, are fairly recently discovered compounds that form when natural oils are ozonated for extended periods of time. Depending on the organic plant oil used, the time of exposure to pure medical grade ozone gas, voltage and amperage in the high-voltage chamber, different compounds with unique properties are formed.

Physiologically compatible ozonides are long-chained, oxygen-rich oils. They are water-free and viscous and formed from natural fatty oils such as olive oil or castor oil and oxygen in the form of ozone. By exchanging three oxygen atoms for the double bond in unsaturated fatty acids, a bactericidal and fungicidal substance is produced (ozonide) which can also attack parasites. Mixed with water, ozonides produce emulsions that can be taken internally. They are popularly used in alternative medicine as a treatment of some Lyme patients. They were already being used clinically between 1915 and 1947 in the U.S., for example, against wound infection in operations and against fungi, bacteria, and viruses in both humans and animals. They have not been widely used since 1947 because antibiotics from fungus cells and synthetic biocides became available in large quantities.

BioPure Healing Products, LLC is committed to providing the highest quality natural therapeutic food products available. Every product is formulated with the utmost concern for potency, purity, biological vitality, and effectiveness.
