LŌC8™ Integration P

Multi-System Integration for Mobile, Web and CMS

Like all of Locate Solutions' applications, the Systems Integration Platform is delivered in the form of customizable, white-label native apps for iOS, Android and browser-based versions with a cloud-based Content Management System (CMS) to manage and integrate the data for all delivery platforms. While this is a more complex methodology than simply delivering a mobile-enabled (responsive) browser version, it enables the incorporation of the powerful current and future functionalities of each operating system.

We can add any functionality that clients desire, whether it be integration with current enterprise systems, indoor/outdoor turn-by-turn ("blue-dot") navigation , people/asset tracking, location-based messaging for safety and marketing, and encrypted communications for file sharing, chat and video. The possibilities are endless. From initial design to delivery to the Apple App Store and Google Play Store, to management and maintenance of the entire mobile and cloud platform, the rapid deployment of the platform is comprehensive and powerful.
