- Power Cable x 1
- AV Connection Cord x 1
- HDMI Connection Cord x 1

- Remote Control x 1
- Instruction Manual x 1
- Quick-Start Guide x 1

Significant Video Projector Specifications Parameter Tips:

What's the difference between "Native Resolution" and "Supported Resolution"?

- Supported Resolution is the video file's resolution that the projector can be accepted to play, but not the projection display resolution. Regularly supported resolution is up to 1920x1080P, but the real resolution the device played depends on the Native Resolution.
- Native Resolution is the true resolution of an image on the physical screen when playing the video. The regular projector on the Market is Native 800x480P, please check the specifications on their product detail page. VACASSO RD-822 Video Projector has a Native 1280x720P Resolution which definitely higher than a regular projector.
- For Example, when displaying a 1080P file movie, if the projector's native resolution is 720P, then the picture quality is 720P. If the native resolution is 480P, the picture quality will eventually be 480P.
