

You are the master of your domain.

At least you could be.

When it comes to temperatures and air quality outside your home you have little control. With the increasing instability of seasonal weather patterns it might be freezing with snow flurries one day, and a sweltering hot heat bubble the next.

What about inside? Do you have a room or basement that just won't warm up? A 2nd floor that becomes impossible to sleep in when the temperatures outside go over 85? An aging furnace or water heater that relentlessly sucks down natural gas and belches out CO₂. A haggard air conditioning unit that rattles and whines like a damaged jet engine about to blow? Dust, dander, and VOCs hang thick in your living room air waiting patiently to be breathed in? Home energy bills as heavy as hard cover encyclopedias?

You are not alone. That is how most have been living.

There is a better way.

One that allows us to independently control the temperature, humidity, and air quality in our homes down to the room level. Advanced technology that utilizes electricity to produce and distribute thermal energy at up to 500% efficiency. An HVAC system that runs whisper quiet, yet has an unmatched ability to provide for the full comfort, air quality, and hot water needs of your entire family.

If taking a new level of control of your indoor environment, while doing right by your communities energy independence and long term climate stability, sounds appealing we'd love to hear from you.

Know More.

Sign up to receive sneak peaks of Aris Hydronics upcoming product launches.

- I like to be warm when it's cold and stay cool when it's hot. Regardless of the "season".
- I have not (yet) fallen in love with my hot water heater.
- I would be okay with my heating source warming just my home and not the entire planet.

Anything else on your mind?
