

## REDUCE PROCESSING. INCREASE PROFIT.

TubeWorks makes any tube bending project a snap by instantly extracting vital manufacturing information and bend data. Whether you are working with native SOLIDWORKS models, common IGES, or Parasolid files, TubeWorks makes it easy to send the right information into your tube bending machine.

Proudly developed by ITEC – the global leader in tube bending.

[WATCH DEMO VIDEO](#)

### SIMPLIFY DESIGN FLOW

With a few clicks, you can import the .STEP or .IGES files and instantly prepare your bend data for production. Accurate data means faster results with fewer headaches so you can spend more time on the parts of your business that matter.

### LESS TIME, MORE SALES

Because TubeWorks saves time, you can send rapid responses to your customer's questions while confidently estimating your project costs with increased accuracy. TubeWorks makes data easy so you can significantly reduce your project timelines and production costs.

### ALWAYS IMPROVING

ITEC is always finding ways to leverage 250 years of tube bending experience into TubeWorks. Customers get access to new features and improvements on our baseline tech – from a searchable tooling log, automated center lines, spring-back calculations, and more!

To be able to quickly and easily pull apart the drawings received from our customers, understand the requirements and then be able to process the work as efficiently as we now do has saved our company thousands of pounds in both quotation time and in the decrease in the amount of setting scrap.

TBF International  
Walsall, United Kingdom

### EASY TO USE

The intuitive and user-focused interface requires no training, which means your production starts immediately after installation.

Applicable Edition:

### UPDATES & SUPPORT

Free online video training via YouTube. Continued service and support is always available with our license contract.

Applicable Edition:

### STEP / IGES IMPORT

TubeWorks can import files in .step or .igs formats.

Applicable Edition:

### OPEN DWG / DXF

A convenient feature to enable viewing of .dwg or .dxf files. The viewer can open 3D DXF files as well.

Applicable Edition:

### MEASUREMENT TOOLS

With a simple click, determine key metrics like bend diameters, wall thickness, and total lengths. Click on an individual tube face and the corresponding vital information is displayed.

Applicable Edition:

### EXPORT PDFS

Export bend data in a professional .pdf report to share part numbers, tube profiles, tube OD, units, CLR, solid model image, and other essential information with your team.

Applicable Edition:

### MANUAL BEND REPORT

Produce an easy to read report containing stop positions, rotations, angles, direction of rotation. This makes bending on a manual machine as easy as following step by step instructions. Apply stretch compensation and display the corrected data.

Applicable Edition:

### EXTRACT BEND DATA

Automatic extraction of all bend data including tube specs like CLR, bend radii plus full LRA and XYZ data. Lite edition pulls data with just one click, while the full edition can automatically pull data upon import.

Applicable Edition:

### CALIBRATE TOOLING

The new TubeWorks tooling calibration feature applies corrected data in the design phase – when optimization matters most. Bend the tube according to instructions, record the result, and TubeWorks will automatically calculate spring-back and stretch. All the data is stored within the tooling log alongside the associated tools.

Applicable Edition:

### STRETCH COMPENSATION

Tool calibration lets TubeWorks apply stretch compensation to the bend regions. This is shown in the overall tube length and intelligently displayed on stop location situations for manual machines where compensation is not applied to straights.

Applicable Edition:

### TOOLING LOG

Not only do you get a centralized database of all your stocked tooling and associated specifications, but the tooling log also stores data from the Tool Calibration feature. This lets you apply tooling on calibrated values to determine corrected bend data.

Applicable Edition:

### OVER-BEND CALCULATIONS

Through tool calibration, TubeWorks calculates over-bend to compensate for spring-back. These calculations are stored by material in the tooling log so you can apply them to future designs.

Applicable Edition:

### BEND ON BEND SUPPORT

Two curves of different radii with no straight separation are well tolerated inside the software. TubeWorks is capable handling bends where compound tooling would be used.

Applicable Edition:

### EXTEND LINE

Now you can extend the endpoints of your central line so you can implement tubes that have worked ends.

Applicable Edition:

### SEND TO BENDER

The highly versatile design exporter at the core of TubeWorks can send your creation directly to the bender as a .\$\$\$ .SV or .S2B file. Or, you can export as LRA or XYZ to include post-processing headers for direct machine import.

Applicable Edition:

### FEASIBILITY STUDY

Compare your imported model with what you've stored in your tooling log to assess if your bend is feasible with the tools you have on hand—an easy way to save time and money on tool resources.

Applicable Edition:

### CHANGE BEND RADII

Embrace complete design customization by changing any of your bend radii so you can change your bend's CLR to match the dies you have in stock.

Applicable Edition:

### DESIGN TUBE

Design a new tube from scratch – no CAD experience necessary. Simply point and click to get precision lengths, angles, and rotations. Or create a tube from an input table. TubeWorks even accepts input of XYZ or LRA values from a file. Manually edit a .\$\$\$ file, import, and TubeWorks does the rest!

Applicable Edition:

### UNBEND TUBE FOR LASER

TubeWorks intelligently unbends tubes for laser cutting and adds material in hand

### VERTICAL CUT PREPARATION FOR LASER

With a single click TubeWorks normalizes

### CREATE FLAT PATTERN FOR 3-AXIS LASER

Are you working in another dimension?

laser cutting and ease material in bend areas to account for stretch. Take out one bend, or unbend the entire tube and mark locations for laser modifications.

Applicable Edition:

With a single click, TubeWorks normalizes your cuts, notches, and holes for laser cutting applications without a 6th axis (head tilt). TubeWorks can also regenerate the centerline to the new, corrected placement.

Applicable Edition:

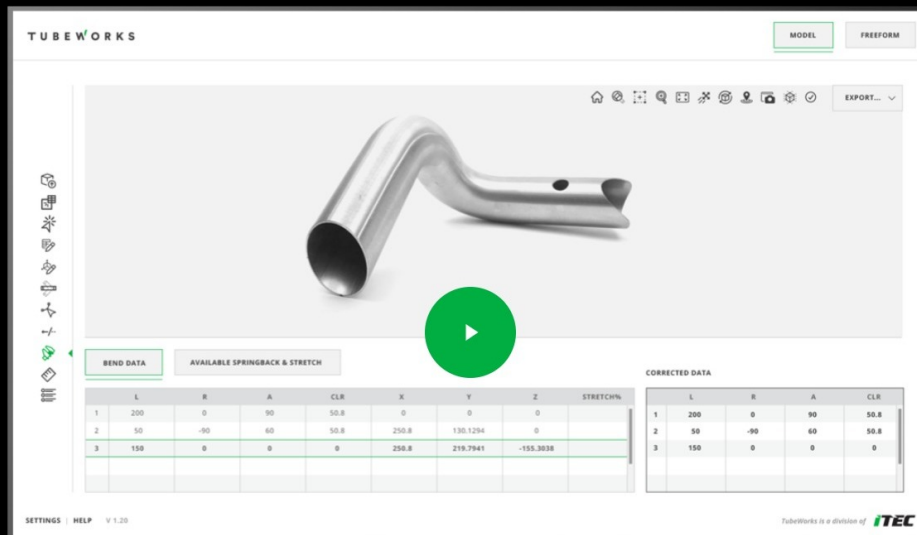

Are you working in another dimension? TubeWorks creates flat patterns for a 3-axis laser as a .dxf file.

Applicable Edition:
