## co-location

### co-location definition - computer

Placing equipment owned by a customer or competitor in an organization's own facility. Telephone companies often allow co-location in order to provide the best interconnection between devices.

#### **Ping Power Pipe**

ISPs offer co-location by providing space, power and a link to the Internet for their customers' servers. They do not perform maintenance or troubleshooting, only a repetitive test to make sure the servers are running. The customer will be notified if the server fails. Known as a "ping power pipe" arrangement, "ping" means sending a packet to the server to see if it responds, "power" is electricity, and "pipe" is the line to the Internet.

Computer distributors and resellers may locate their warehouse within the PC vendor's facility to improve turnaround time to resellers and customers. Contrast with [managed services](#).

## Web hosting

### web hosting definition - computer

Making a Web site available on the Internet. Many ISPs host a few personal Web pages for an individual at no additional cost above the monthly service fee, but the address is subordinate to the ISP; for example, [www.friendlyisp.com/pat\\_smith](#).

Multi-page, commercial Web sites are hosted at a very wide range of prices, and the customer's registered domain name is used. A single computer can hold dozens to hundreds of small Web sites, while a dedicated computer or multiple computers (from a handful to thousands) may be used for one large Web site.

#### Entirely or Partially Managed

Web hosting organizations can provide full service, including site design and programming as well as all e-commerce facilities. If customers wish to use their own servers and software, all their privately owned equipment can be co-located at the ISP, which provides power, Internet access and some level of management, which may be as little as ensuring that the servers are always running.

#### Host Yourself

Many medium to large enterprises host their own Web sites and manage their own servers in their own facilities. Even home users can try, although many ISPs block traffic going to a customer's Web server (see [DDNS relay](#)). See [ISP](#), [co-location](#) and [how to register a domain name](#).
