SPECIAL BUNDLE PRICING

Purchase **BootIt BM and Image for Windows** (includes Image for DOS/Linux/UEFI and OSD Tool Suite Pro) together and receive them all for one low price.

All six products for only \$49.98!

BootIt® Bare Metal (BootIt BM, or BIBM™) has it all, partition manager, boot manager, and disk imaging. Easily resize, copy, slide, and delete partitions. Configure booting of multiple operating systems, including Windows and Linux. Quickly fix Windows BCD booting problems using the built-in BCD file editor. Use the included full version of Image for DOS to create and restore backup images of your hard UNITS.

Image for Windows (IFW) is a Win32-based drive image backup and restore utility that creates or restores a snapshot of an entire partition or volume. The backups can be saved to a set of files on a local or network drive, or directly to most CD or DVD drives (which will create a bootable restore disc). If something should ever happen to that partition or volume, you will be able to simply restore the snapshot image.

Image for DOS (IFD) is a DOS-based drive image backup and restore utility that creates or restores a snapshot of an entire partition or volume. The backups can be saved to a set of files on a local or network drive, or directly to most CD or DVD drives (which will create a bootable restore disc). If something should ever happen to that partition or volume, you will be able to simply restore the snapshot image.

Image for Linux (IFL) is a Linux-based drive image backup and restore utility that creates or restores a snapshot of an entire partition or volume. The backups can be saved to a set of files on a local or network drive, or directly to most CD or DVD drives (which will create a bootable restore disc). If something should ever happen to that partition or volume, you will be able to simply restore the snapshot image.

CopyWipe™ is a **FREE** utility for copying or securely

overwriting (wiping) entire hard drives.
