### Nano Mill Zeta

The nano mill Zeta<sup>®</sup> RS is the next development of the worldwide known circulation mill system Zeta<sup>®</sup> type LMZ.

Its field of application starts where the other agitator bead mill system Zeta<sup>®</sup> ends. The highly efficient centrifugal separation system enables the use of smallest grinding media

from a diameter of 50 – 300 µm in reliable continuous operation.

It is specially designed for wet grinding and dispersing processes especially „gentle dispersing“ in the nanometer range. Working with the machines is a pleasure due to its easy operation.

The agitator bead mill Zeta<sup>®</sup> RS is equipped with a swiveling grinding unit and lifting device with multiple positions for easy emptying, filling and cleaning and a horizontal working position.
