BENEFITS AND RISKS DBS THERAPY FOR OCD

HOW DBS MAY HELP

Through a Humanitarian Device Exemption, Reclaim™ DBS Therapy for OCD* is available for use as an adjunct to medication and as an alternative to anterior capsulotomy for treatment of chronic, severe, treatment-resistant obsessive-compulsive disorder (OCD) in adult patients who have failed at least three selective serotonin reuptake inhibitors (SSRIs).

PROBABLE BENEFITS

Reclaim DBS Therapy for OCD may help manage your symptoms, but it is not a cure. When your DBS system is turned on, it will deliver stimulation that may decrease your OCD symptoms. If stimulation is discontinued, symptoms will likely return.

- **Non-destructive** – Reclaim DBS is not intended to destroy nerve cells or healthy tissue in the way that lesioning surgery does.
- **Reversible** – Deep brain stimulation is reversible. If the therapy is not effective, it can be stopped and the system can be removed.
- **Adjustable** – Your clinician uses a special computer to wirelessly adjust the levels of stimulation. It may take several months to find the exact level of stimulation that is right for you.

Important Safety Information

LIVING WITH DBS THERAPY

After surgery, the next step in your OCD treatment is adjusting to life with DBS therapy.
