highways, roads & bridges

The motor vehicle is the preferred mode of transport across much of the world for people and freight. It provides personal mobility and flexibility in transportation - so long as the road network is there.

From planning through design to construction management and overall project/program management and asset support, we have the team to meet your transportation needs. Our clients include many departments of transportation across North America, and in recent years, we have been a key part of many major projects delivered under a P3 model. Our services include planning and route selection; traffic analysis; traffic forecasting; geometric and pavement design; traffic signals; bridges, retaining and drainage structures; ramps, roadways and streets; lighting design, noise barriers; as well as construction supervision and administration, and program and quality management.
