Onsite Solar

From professional football stadiums and municipalities to university campuses and corporations, our onsite solar solutions are allowing customers to generate and use electricity cleanly and efficiently through readily available technologies – right now.

NRG staked its position as a national leader in developing systems in 2011. Since then, we've developed several unique local solar installations in Arizona, including 12.9MW of solar spread across the Arizona State University campus, at a dozen Arizona public schools and a system that powers a cooling station at one of Phoenix's busiest METRO light rail stations.

From here, NRG continues to grow its leadership position in developing and deploying both utility and distributed commercial solar projects throughout North America.
