

How it works

Design a Custom Simulation

Work directly with our experts to analyze your protocol or smart contract and identify the top attacks and incentives to model.

Integrate with your protocol or smart contract

Our team will construct a simulation customized to your product and tune it to get the best coverage of possible attack scenarios. We fully support the EVM and can run Solidity or Vyper contracts directly in our framework, as well as intergrate with custom VMs and protocols.

Build custom agents for your network

Using the requirements we gathered during simulation design, we'll develop any new types of agents that are needed for your protocol or smart contract. Combining these with our library of agents and attacks, we achieve broad coverage of testing scenarios.
