Security.txt

Security September 2, 2020

Want to help improve Doppler's security? Our [security.txt](#) shares how to do so safely and securely.

```
Contact: mailto:security@doppler.com
Preferred-Languages: en
Encryption: https://dashboard.doppler.com/keys/security-publickey.txt

Policy: https://docs.doppler.com/docs/security-fact-sheet#responsible-disclosure
```

Universal CLI Updates

Improvement August 31, 2020

You can now run **doppler update** on any machine to automatically upgrade to the latest version. And it's lightning fast. Try it out!

```
brian:services/server (develop)$ doppler update
```

Secrets Referencing!

New August 12, 2020

Have a ton of duplicate secrets? Now you can add your secret to just one config and then reference it from everywhere else!

Here's how:

- Within a config: `${STRIPE_KEY}`
- Within a project: `${stg.STRIPE_KEY}`
- Across projects: `${billing.stg.STRIPE_KEY}`

Once you have a secret being referenced, if you change that secret all references to it will automatically update.

compression > **prd** 

[Save](#) [...](#)

This is the root config for the **Production** environment. All configs in the environment branch off of this config. When secrets are modified in this config, all branched configs will smartly inherit the update.

External References [Settings](#)

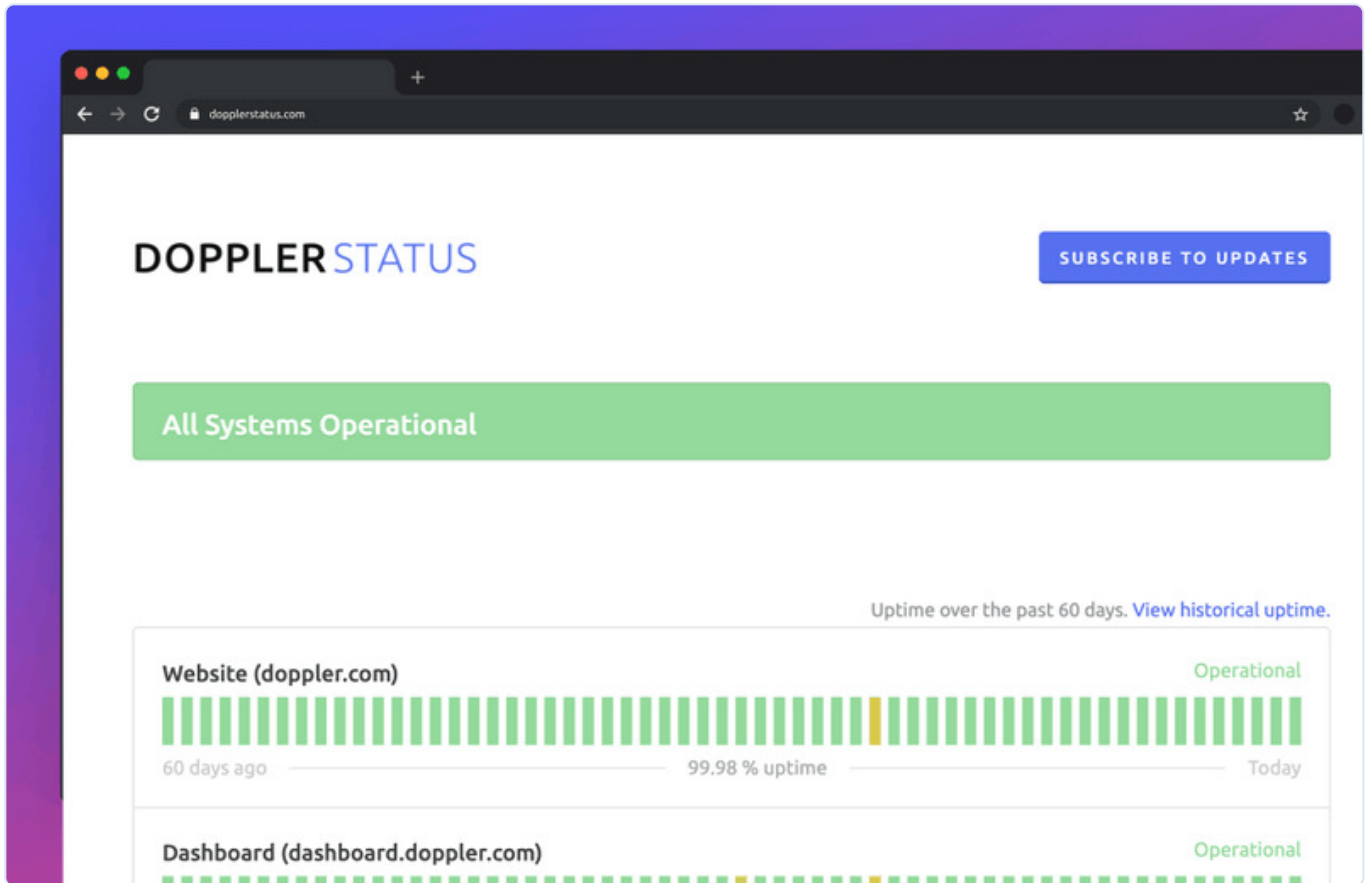

Manage the external references to secrets in this config.

There are no secrets being referenced by another config. [Learn how to create a reference.](#)

New Status Domain

Improvement August 5, 2020

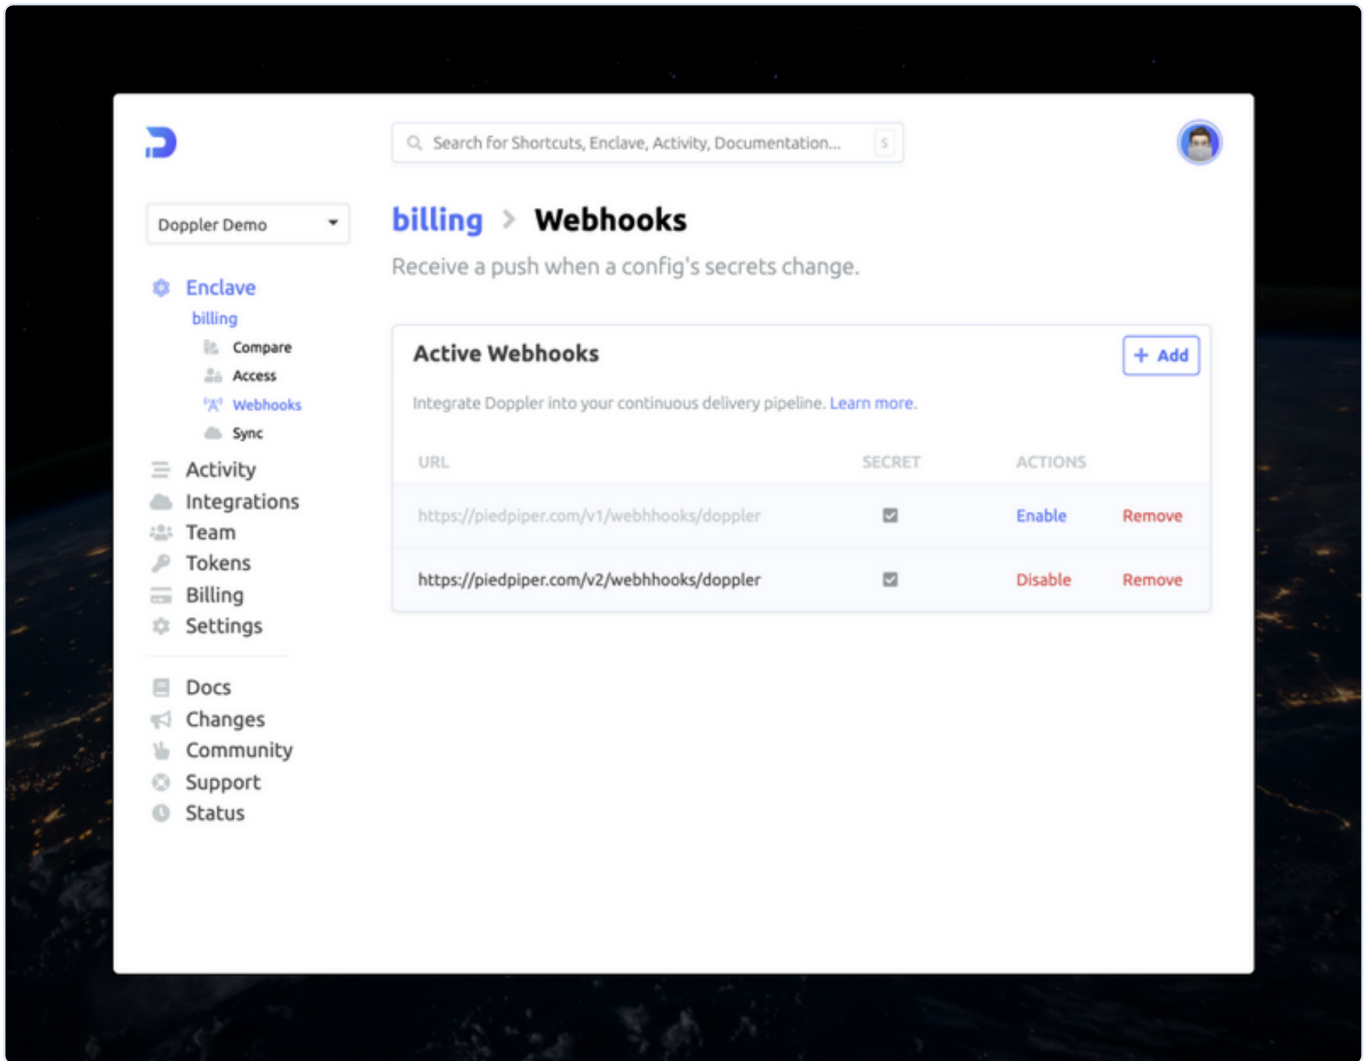

In light of the recent Cloudflare DNS outage, we embarked on separating our status page infrastructure from our primary services. Our new status page is hosted at dopplerstatus.com and uses a different registrar and DNS provider than our doppler.com domain. This helps ensure that a domain-wide outage cannot bring down our status page.

Enable/Disable Webhooks

Improvement July 30, 2020

Want to get notified in your service about changes in your configs? You can now easily setup webhooks and enable/disable them.

30-day Trials

New July 27, 2020

Want to test out one of the paid plans without putting in your credit card, we totally get it! Today you can now do just that with a 30-day free trial.

The screenshot shows the Doppler website's pricing page. The header includes the Doppler logo, navigation links for Changes, Pricing, Community, Developers, and Company, and a Sign In button. The main heading is "Plans that scale with you" with a sub-heading "Simple transparent pricing that scales from individual developers to large businesses".

Welcome Ruud Visser

New July 24, 2020

We are all super excited to introduce Ruud Visser to the Doppler team. Before joining Doppler, Ruud led backend API infrastructure at Instagram! We can't wait to see what he ships next.

If you are passionate about developer tools or security, we are hiring Full Stack Engineers, Security Engineers, Developer Advocates, and Designers. **Come join us!**

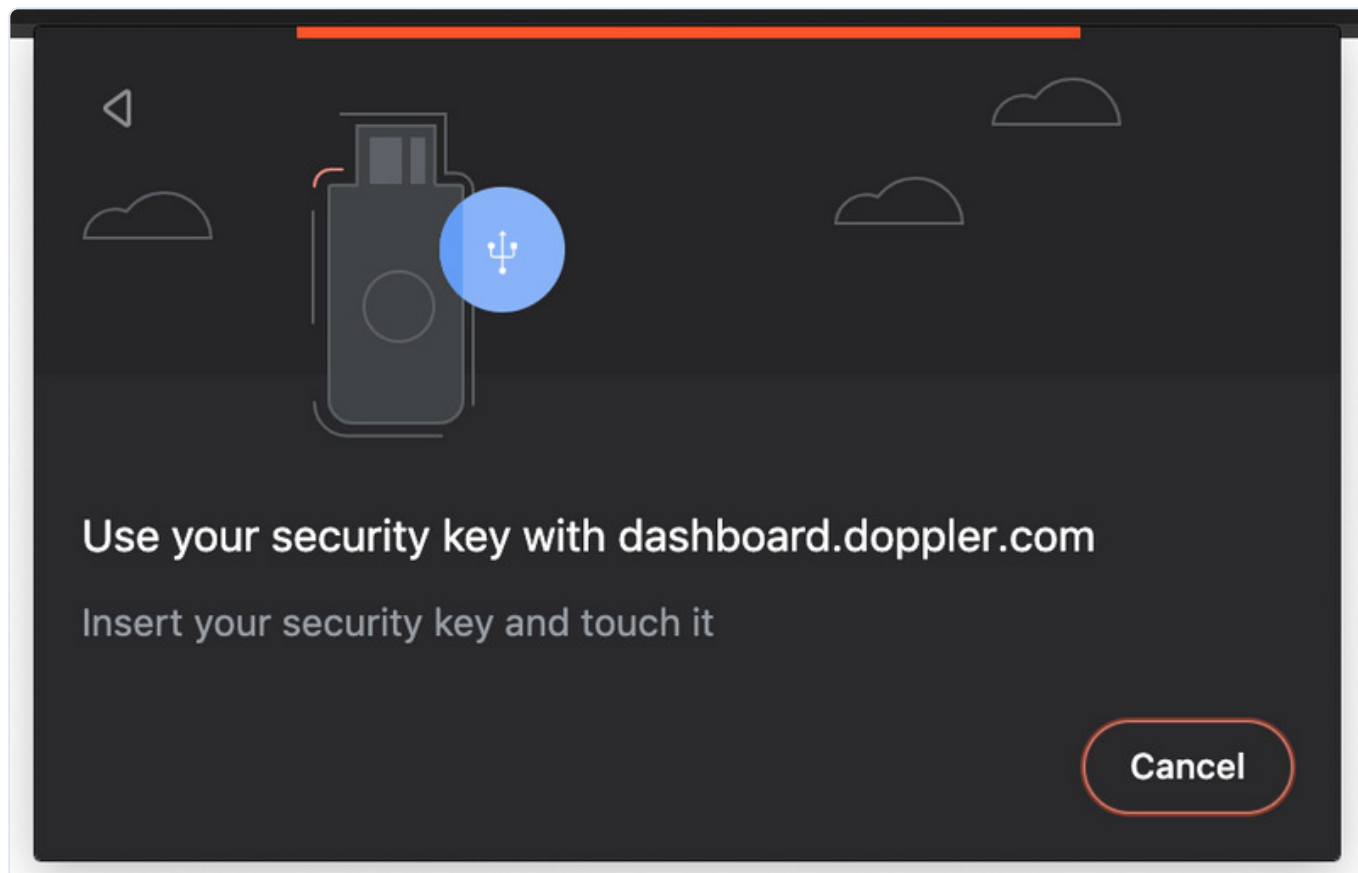

MFA: YubiKey support

Security July 22, 2020

We've rolled out support for our most requested MFA method: security keys! You can now use a YubiKey and other WebAuthn-based security keys as an additional factor

during login. Security keys can be added in addition to OTP/Authy, and we support multiple keys from day one. One piece of personal advice: always add a backup key!

Members Can Now Leave A Workplace

Improvement July 20, 2020

Everyone should have a choice of if they want to be part of a workplace, regardless of their access. Now any user, including someone with member access, can leave a workplace.

Team

View team members and manage your membership.

Users

USER	ROLE
 Bob Marley bob@doppler.com	Member
 Brian Vallelunga brian@doppler.com	Owner

Leave Workplace

Once you leave a workplace, you will lose access to all of its projects and configs. To rejoin, you must be invited by an existing Workplace owner.

Smarter Secret Names

Improvement July 17, 2020

Secret names are tricky to get right, you want them to be uppercased and use underscores to make sure they work everywhere. But remembering all these arbitrary rules isn't fun, so now you don't have to. Doppler will automatically map your secret names as you type, like converting a space to an underscore. Just type, we will handle the rest!

compression > **dev** 

[Save](#) [...](#)

This is the root config for the **Development** environment. All configs in the environment branch off of this config. When secrets are modified in this config, all branched configs will smartly inherit the update.

Project Slugs Reimagined

Improvement July 2, 2020

All new Enclave projects are now referenced by their name. This makes for a much smoother experience when interacting with our APIs and CLI.

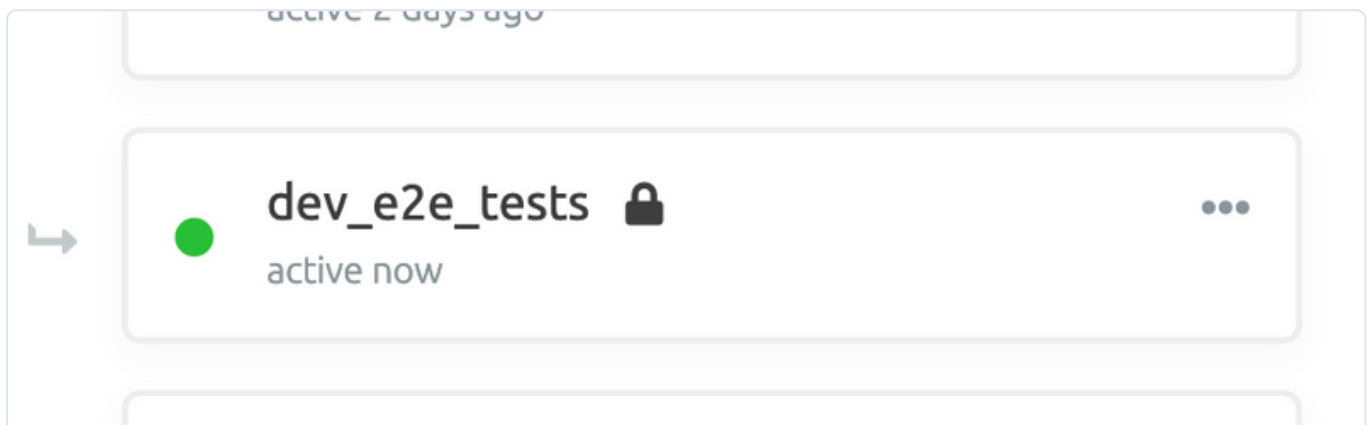

Current projects will continue to use their existing slug. To switch an existing project to a name based slug, simply rename your project.

Old: ep_2d5d34e129d
New: compression

Lock your Enclave configs for added protection

New June 30, 2020

After recently deleting the wrong test config, we were humbly reminded that accidents happen. This led us to build our newest feature: config locking. Locking an Enclave config prevents it from accidentally being renamed or deleted. To perform one of these actions on a locked config, simply unlock.

Doppler CLI now available via GitHub Actions

New May 27, 2020

The Doppler CLI is now a full-time CI resident! Check out [the Action](#) on GitHub Marketplace to start using it in your GitHub Workflows today.

GitHub Action

Install Doppler CLI

v1 Latest version

[Use latest version](#)

Install Doppler CLI action

The [Doppler CLI](#) is the official tool for interacting with your Enclave secrets and configuration. This action installs the latest Doppler CLI into your PATH.

Example usage

Include this Action as a step in your workflow:

```
uses: dopplerhq/cli-action@v1
```

You can see a live example of this Action [here](#).

Install Doppler CLI is not certified by GitHub. It is provided by a third-party and is governed by separate terms of service, privacy policy, and support documentation.

A Self Updating CLI

Improvement May 13, 2020

For Homebrew users, you can now update the Doppler CLI with the **doppler update** command as of [version 3.1.0](#).

```
brian:services/server (master)$
```
