

Energy Storage Systems for Government Buildings

Government

POWERSYNC designs and builds advanced energy storage systems (ESS) that are for critical government installation and operations.

Our advanced energy storage systems allow local, state, and federal governments to mitigate economic risks associated with power disruptions.

Our Government solutions, like our C&I solutions are designed for low or high voltage single, split or 3 phase electrical architecture and easily integrates with a broad selection of high power inverters, power control systems, and energy management systems.

POWERSYNC protects government agencies by:

- ✓ Improving energy resilience with an energy storage system that allows for critical loads backup.
- ✓ Reducing energy costs by eliminating utility peak demand charges
- ✓ Maximize renewable self-consumption and participate in demand response programs.
- ✓ Prepare for the future shared energy market with your commercial virtual power plant.
