IGUANA CONTROL

As Florida's largest Iguana control company, we have the tools, wildlife experts, and on-site staff ready to control and reduce the [green iguana](#) population that is residing on your property.

Land Surveying

Our team arrives on-site to survey your property's premises to search for any holes in the ground that iguanas can use to lay their eggs. These burying holes are breeding grounds for iguanas and are often found near sea walls or next to bodies of water. If left unchecked, an uncontrolled population of iguanas can multiply and

destroy the landscape of your home or the greenery that is surrounding your business. We also consult with you on how to maintain the trees that are on your property so as to prevent iguanas from climbing on them. Big trees near your property can give iguanas easy access to get on the roof of buildings. The iguanas will claw and search for crevices to take shelter, which can cause damage to the roof.

Capturing

Some Iguanas can be stubborn and will take more effort to remove, especially if they have learned how to avoid humans. We have very effective traps that will successfully capture the iguanas intruding on your property, but this is usually a last-resort option as the majority of our services are preventative.

Property Protection

If your home or business is on a large piece of land, we offer your property total topography protection. This means our team of technicians will survey the area and protect your land with our products and monitoring methods. There can be numerous iguana nests on a piece of land that can go unnoticed for long periods of time that could be harboring a whole population of iguanas and this can harm the vegetation and landscape of your property. We treat large areas of land and remove the dozens of holes iguanas have created.

Application of Tools

All Iguana Control technicians are trained in the installation and application of our full-line of iguana control products. There are indicators that hint at the presence of iguanas and their homes, and our team knows how to pick up on these details.

Tree Wrapping

Iguanas can make their nest in trees, but our tree wraps prevent iguanas from creating their nests in the first place. If they are already nesting in a tree, our on-site technicians will remove the iguanas and immediately install the tree wrap to prevent other iguanas from climbing up the same tree in the future, which will discourage iguanas from creating nests on trees.

Anti-Iguana Barrier

We install barriers that are designed to deter iguanas from entering your property. Whether your land is freestanding from other properties or connected to neighboring businesses or homes, our custom-installed barriers prevent iguanas from trespassing.

Anti-Hole Barrier

Holes dug in the ground are the work of iguanas that are in the heat of the breeding season. If left unchecked, holes can eventually turn into a network of tunnels and burrows that will enable iguanas to safely lay their eggs. We install barriers meant to cover these holes hidden by dirt and vegetation. Iguanas won't be able to enter into the holes they dug.

Sea-Wall Barrier

Bodies of water such as canals and other waterways are some of the most popular places iguanas like to hang around. These unwanted guests can use channels of water to trespass onto properties and wreak havoc on the landscape. We place barriers that iguanas cannot climb near bodies of water to prevent them from crossing over onto homes and businesses.

Dock-Piling Wrap

For waterfront homes or properties near a body of water, we install dock piling wrap that will deter iguanas from climbing the pilings on your dock.

Iguana Control Landscaping

In order to survive and thrive, iguanas will use their immediate surroundings for nesting, laying eggs, and staying hidden if they feel threatened. That is why at Iguana Control, we provide a landscaping service that involves trimming trees, bushes, and other foliage that will discourage iguanas from staying on the property.

IGUANAS ARE AN **INVASIVE SPECIES**

Iguanas are an [invasive species](#) to Florida. Therefore, demand exists to [remove](#) these invaders from properties that are being affected by their intrusive behavior and breeding patterns. They are agile and can run fast in short bursts, have claws that enable them to climb trees with ease, and can breed in overwhelming numbers. They are originally from South and Central America, Mexico, and some islands in the Caribbean.

By their sheer numbers, iguanas can cause long-term damage to the landscape of residential and commercial properties. They are very often considered by property owners to be pests that need to be removed or relocated. Iguanas can also leave their feces in areas like docks, porches, decks, patio areas, and even inside swimming pools.

Can I remove iguanas from my property? ^

If you are willing to remove them on your own, you are more than welcome to as iguanas are not protected by the state of Florida except by anti-cruelty laws and can be killed humanely. The Florida Fish and Wildlife Conservation Commission (FWC) encourages homeowners to remove iguanas from their properties. Anyone, in

general, can also remove or kill iguanas without a license or permit under [Executive Order 20-17](#). However, iguanas that are captured can't be relocated or released to another location in Florida. If the removal of your iguana infestation from your property proves to be troublesome, you can call our team at Iguana Control and we will handle the iguanas for you.
