

Lithik Security Manager Vulnerability Assessment About Us Contact Lithik

### Missing Patches on Windows Machines

## Lithik Security Manager

Security Manager, which aims to help you in three broad categories.

## Monitor

It's impossible to secure a network if you don't know where the insecurities lie. With detection and continuous monitoring as the cornerstone of its design, the Lithik Security Manager will let your staff see what's happening on your network and gain a new level of understanding of what your current situation actually is. No amount of sifting through software specific administration consoles or Windows Group Policy comes close to giving you this kind of insight.

With vulnerability scanning performed using either your own Nessus Professional Feed subscription or using the free and open source OpenVAS scanner, you will have a complete listing of what vulnerabilities are present. One unfortunate thing about these scanners is that the results come in the form of a multi-hundred page long PDF that doesn't easily translate data to understanding. The Lithik Security Manager takes this data and correlates it with your inventories of devices, installed software, and Windows Active Directory Users and Groups in a way that's intuitive and accessible.

## Manage

Once you understand where your risks are, you may be tempted to print off a list of vulnerabilities the Lithik Security Manager has marked as critical and start working through it by hand. This is where the LSM sets itself apart from other management systems. Our system is automated and will apply patches and fix vulnerabilities through the Lithik Security Manager Automation Policy features. It's not uncommon for the number of missing security patches on your network to drop by over 90% in the first week, even when the network already had a patch management solution in place. This allows you to spend your time working on the few issues that require manual intervention while letting the Lithik Security Manager do the heavy lifting.

## Report

Even the most effective security program won't give you peace of mind unless you can see that it's working. With a multitude of graphs and historical data on how the security of your network is changing, the Lithik Security Manager makes it easy to see the improvement. Whether you want a quick check on your patch score from the home page or a complete PDF report on every aspect of your network's health, the Lithik Security Manager will prove to you and others that your network's security is getting better day by day.
